WIKIURBIA M[APP]-ing Wikitopia

Since ever-changeability lies in the foundation of Wikitopia, the current project proposes an accessible participatory app for everyone where users will be able to map, express, augment , envision, edit, interact and construct the world they dream of and aim for, through an everchanging digital map which will be an expression of their thoughts, ideas, visions and hopes. With WIKIURBIA m[app] people will be able to participate in the planning and improvement of their surroundings by continuously conceiving the city of tomorrow.

Proposals and visions constructed on the M[app] would take effect immediately through their augmented reality projection for a limited time and citizens will be able to assess their designs before these are built in reality. In this way, designs will be open for improvement and critical judgement and in case the proposals are not good enough for their environments, they won't take effect.

Similarly to Wikipedia, the M[app] would be free to use while relying on donations.

The Mapp will be a single world map where miscellaneous layers of actions, interactions, propositions, comments are superimposed to continuously shape the future city, allowing people to overlay virtual information onto the urban environment. The app will feature both two and three- dimensional projections of space where users will be able to propose new spaces and modify existing ones through a user-friendly interactive digital environment, thus becoming a powerful tool for planning and conceiving the city of tomorrow.
